### Summary ;

*This study aimed to examine the relation between exposure to trauma events which followed beet hanoun crisis and the Psycho somatic disorders among Palestinian adults from three places in the Northern governorate of Gaza. 451 adolescents was exam end by using Psycho somatic questionnaire, the result of the study shows the following findings: there is high percentage of Psycho somatic problems among beet hanoun adolescents than other places, and the results of the study show that females from beet hanoun are higher than miles. And adolescents who was exposed personally to traumatic events or noticed other people exposed in front of them are more psychosomatically problem than other people.*
